

SOP — Mike's Daily KPI Tracker

Audience: Mike (data manager) + Aaron (owner reviewing performance).

Purpose: Define exactly what Mike needs to hit each day, how it gets tracked, and the Google Sheet that makes performance visible without weekly debate.

Daily KPI targets (the goals)

Mike's day is measured on **5 input metrics** and **3 outcome metrics**. Inputs are what he controls (effort + activity). Outcomes are what the system + market produce.

Input KPIs (Mike's controllables — non-negotiable daily)

KPI	Daily target	Why it matters
SMS sent — Day 1 (new records)	100% of qualifying records (Tier 0-2 phones)	Every new record from autonomous run gets Day 1 outreach within 24 hrs of upload
SMS sent — Day 2/3 follow-ups	100% of records eligible per cadence	No leads slip through cracks — if cadence says Day 2, Day 2 SMS goes out
Phone calls attempted	Min 30 dials/day (Tier 0-2 records on Day 4+)	After SMS stage, calls are next. 30 dials = ~2 hrs of dial time
Records tagged after each touch	100% (sms_sent_dayX, called_dayX, etc.)	If Mike doesn't tag, the cadence breaks tomorrow
Status updates on engaged records	100% same-day	"New" → "Contacted" → "Interested" → "Appointment" — keeps pipeline visible

Outcome KPIs (system + market produce these — Mike influences via quality)

KPI	Daily target	Weekly target
SMS reply rate	8-15% of Day 1 SMS sent	Track per variant (A/B/C)
Positive replies (interested/question, NOT stop/no)	2-5% of Day 1 SMS sent	5-15 positive replies per week
Hot leads escalated to Aaron	1-3 per day	5-15 per week
Calls connected (>60 sec convo)	30%+ of dials = ~9 connections from 30 dials	45+ connections per week
Appointments set	Variable (target: 2-5/week)	2-5 booked calls with Aaron

Stop-loss KPIs (red flags requiring escalation)

Metric	Threshold	Action
SMS reply rate	< 5% for 3 consecutive days	Pause cadence, A/B test new variants
Positive reply rate	< 1% for 5 consecutive days	Tag/preset/data quality audit
Connection rate (calls)	< 20% for 3 days	Phone tier scoring may be off; check Trestle
Records with zero touches at Day 7+	Any	Mike's slacking — meeting with Aaron

Conversion funnel — the math Mike works toward

Daily autonomous run produces: ~100 new records (target steady state)
↓
Mike's Day 1 SMS goes to: ~75 records (Tier 0-2 phones, skip 4-5)
↓
Reply rate at 10%: ~7 replies
↓
Positive replies at 30% of replies: ~2 interested per day
↓
Convert to call within 48 hrs: ~1.5 calls per day
↓
Appointment set rate at 40%: ~0.6 appointments per day = 3-4/week
↓
Aaron closes at 25-30% of apptmts: ~1 deal per week → 4-5/month

Healthy funnel = 1 deal/week from ~75 SMS/day input. That's the math Mike works toward. If the conversion rates above hold and volume is at 75 SMS/day, deals follow.

If reply rates are below 8%, either:

- Templates aren't resonating (A/B test new variants — see [SOP-SMS-TEMPLATES-V2.md](#))
- Phone tiers are off (data quality issue)
- Wrong segments being worked

The Google Sheet Mike fills out daily

Sheet name: Mike's Daily KPI Tracker

Owner: Aaron's Google account (shared edit access with Mike)

Why a Sheet, not DataSift: DataSift has the raw data but not the layout that makes daily performance + weekly trends pop visually.

Sheet structure

3 tabs:

Tab 1: Daily Log (Mike fills out at end of each day)

One row per day. Columns:

Date	SMS Day1 sent	SMS Day2 sent	SMS Day3 sent	Calls attempted	Calls connected	Hot leads tagged	Appointments set	Notes / Blockers
2026-05-01	73	45	22	28	9	2	0	Phone tier 5 was 18% today — high
2026-05-02	...	...	...	...	...	...	...	...

Mike's end-of-day routine (5 min):

- Open Sheet
- Pull counts from DataSift (filter today, count records with each tag)
- Type into row, save

Mike's morning check (1 min):

- Glance at yesterday's row
- Note any KPI miss → adjust today's plan

Tab 2: Weekly Rollup (auto-formulas — Mike doesn't edit)

Aggregates Daily Log into week-over-week view. Columns:

Week of	Total SMS	Total replies	Reply rate	Positive replies	Pos rate	Hot leads	Apptmts	Deals closed	Cost (Tracerfy + Trestle + DataSift)	Cost per deal
2026-04-26	...	...	...	...	...	...	...	...	...	...

Aaron reviews this weekly during Friday Review ([SOP-WEEKLY-REVIEW.md](#)).

Tab 3: Per-Preset Conversion (auto-formulas)

Tracks reply rate + conversion by preset, so we know which segments perform:

Preset	SMS sent (week)	Replies	Reply rate	Positive	Pos rate	Hot leads	Notes
FTM_LP_Mont	...	...	...	...	...	...	A/B variant winning: B
FTM_LP_Franklin	...	...	...	...	...	...	...
... (all 10 presets)	...	...	...	...	...	...	...

Tells us where the leverage is. If FTM_Probate_Franklin converts 4x better than FTM_SS_Greene, prioritize Mike's time accordingly.

How the Sheet gets data

Phase 1 (week 1) — Manual

Mike fills out Tab 1 (Daily Log) by hand at end of each day. He pulls counts from DataSift's filter UI:

- SMS Day 1 sent today: filter records with `sms_sent_day1` tag added today
- Replies: filter `responded_v1*` or `interested` or `not_interested` or `stop` tags added today
- Calls attempted: filter `called_day1` / `called_day2` / `called_day3` tags added today
- Hot leads: filter `hot` tag added today
- Appointments: filter status changed to `Appointment` today

Tabs 2 & 3 auto-aggregate via Sheet formulas (SUMIFS / COUNTIFS).

Phase 2 (week 3+) — Auto-population

Once we've validated the manual flow, I'll extend `gsheet_writer.py` to write Mike's daily KPI row automatically:

- After each daily run, the SiftStack pipeline appends Mike's row data to Tab 1
- Mike just verifies + adds qualitative notes
- ~2 minutes/day of his time vs 5-10 manual

The data we already track in `daily_summary.csv` covers most of this — we just need to also pull Mike's tagging activity from DataSift (records with each tag count, per day).

Concrete daily targets per preset volume

Assuming steady-state ~100 new records/day from autonomous run, here's the breakdown:

Probate (~20 records/day, all 3 counties combined)

Day 1 SMS: 18 records (skip 2 entity-owned)

Reply target: 2-3 (probate has highest emotional weight, ~12% reply)

Positive: 1 (probate converts at ~5% positive)

Foreclosure / Sheriff Sale (~50 records/day, 3 counties)

Day 1 SMS: 40 records (skip Tier 4-5 + commercials)

Reply target: 4-6 (urgency drives ~10-12% reply)

Positive: 1-2 (~3-5% positive)

Lis Pendens (~25 records/day, 3 counties – once Mike's prsts populate)

Day 1 SMS: 20 records

Reply target: 1-2 (early-stage, lower urgency, ~6-8% reply)

Positive: 1 (~5% positive)

Tax Sale (~10 records/day, Mont only for now)

Day 1 SMS: 8 records

Reply target: ~1 (mixed motivation, ~10% reply)

Positive: 0-1

Redemption Window (varies – sporadic)

Day 1 SMS: ~5 records when present

Reply target: 1+ (high motivation, ~15% reply)

Positive: 1 (very high conversion when in window)

DAILY TOTAL TARGETS:

SMS sent: ~70-90/day

Total replies: ~9-13/day (12% blended reply rate)

Positive replies: ~3-5/day

Hot leads escalated to Aaron: 1-3/day

Appointments booked: 0-1/day (~3-4/week)

Mike's morning checklist

Print this and put it next to his monitor:

- 9:00 AM – Open Slack, read overnight summary
- 9:05 AM – Open DataSift, apply yesterday's date filter to verify autonomous upload landed
- 9:10 AM – Apply preset 7 FTM_Probate_Mont → Day 1 SMS to Tier 0-2 phones (V2 templates)
- 9:25 AM – Apply preset 8 FTM_Probate_Franklin → Day 1 SMS
- 9:40 AM – Apply preset 9 FTM_Probate_Greene → Day 1 SMS
- 9:55 AM – Apply preset 4 FTM_SS_Mont → Day 1 SMS (urgency variant if <14 days)
- 10:10 AM – Apply preset 5 FTM_SS_Franklin → Day 1 SMS
- 10:25 AM – Apply preset 6 FTM_SS_Greene → Day 1 SMS
- 10:40 AM – Apply preset 1-3 FTM_LP_* → Day 1 SMS
- 10:55 AM – Apply preset 000 FTM_RW (redemption) → Day 1 SMS
- 11:10 AM – TAG every record sent with sms_sent_day1
- 11:15 AM – Review responses from yesterday's batch → tag/respond
- 11:30 AM – Phone call window opens – work Day 4+ records
- ...
- 4:30 PM – End-of-day: fill out Tab 1 of KPI Tracker Sheet
- 4:45 PM – Tag any deals closed → Sold Property Cleanup auto-fires
- 5:00 PM – Done

Weekly Friday review (Mike + Aaron, 30 min)

Every Friday at 4 PM:

1. **Mike opens KPI Tracker → Tab 2 (Weekly Rollup)** — pulls this week vs last 4 weeks
 2. **Discusses 3 wins, 3 misses, 3 priorities** for next week (per [SOP-WEEKLY-REVIEW.md](#))
 3. **Reviews Tab 3 (Per-Preset Conversion)** — which preset is winning, which needs A/B refresh
 4. **Aaron commits to fixes** Mike can't do himself (preset edits, scraper changes, etc)
 5. **Pin commitments in Slack**
-

When Mike falls below targets

If for 3+ days in a row Mike's input KPIs miss target:

- **Day 1 SMS sent < 100% of qualifying records** → ping Aaron same-day
- **Calls attempted < 20/day** → flag in Friday review
- **Records untagged after touches** → immediate retraining (1-on-1)

If outcome KPIs miss for a week:

- **Reply rate < 5%** → schedule emergency A/B test session, refresh templates
 - **Positive rate < 1%** → audit data quality (phone tiers, address validation, preset filters)
-

How Aaron uses the Sheet

Daily (1 min): glance at yesterday's row in Tab 1. Anything red? Slack Mike.

Weekly (10 min): Tab 2 trend lines. Are reply rates rising or falling? Cost per deal trending right way?

Monthly (30 min): Tab 3 per-preset analysis. Reallocate Mike's time toward winners. Drop or revamp losers.

Quarterly (1 hr): Big-picture review with cost data. Is the unit economics working? Should we scale up volume or improve quality first?

Setup steps (one-time)

Step 1 — Aaron creates the Sheet

1. Open <https://sheets.google.com> → Create new
2. Name: "Mike's Daily KPI Tracker"
3. Tab 1: rename "Sheet1" → "Daily Log"
4. Add headers from §"Daily Log" above
5. Tab 2: create "Weekly Rollup" – add formulas from §below
6. Tab 3: create "Per-Preset Conversion"
7. Share with Mike's Google account: edit access
8. Pin to Mike's Drive

Step 2 — Tab 2 Weekly Rollup formulas

Paste these into A1 of Tab 2 (assuming Tab 1 has 30 rows of data starting row 2):

```
=ARRAYFORMULA(IF(LEN(A2:A100)>0, "Week of "&TEXT(A2:A100-WEEKDAY(A2:A100,2)+1, "yyyy-mm-dd"), ""))
```

Rest of weekly aggregation:

```
B (Total SMS): =SUMIFS('Daily Log'!B:B, 'Daily Log'!A:A, ">="&A2, 'Daily Log'!A:A, "<="&A2+6)
C (Replies): =SUMIFS('Daily Log'!E:E, 'Daily Log'!A:A, ">="&A2, 'Daily Log'!A:A, "<="&A2+6)
D (Reply rate): =IFERROR(C2/B2, "")
... etc
```

I'd recommend Aaron build this once + reuses every week. ~30 min one-time setup.

Step 3 — Mike's daily routine for the Sheet

Every day at 4:30 PM:

1. Open the Sheet
2. New row in Tab 1 with today's date
3. From DataSift, count records tagged `sms_sent_day1` today → enter in column B
4. Repeat for other tags (`Day 2`, `Day 3`, `called_day1`, `hot`, etc.)
5. Notes column: anything weird, blockers, ideas
6. Save
